

Medixine-Powered Nonin Health Platform Now Live — Elevating Patient Care with Seamless Pulse Oximetry Access

Espoo, Finland – 18.2.2026 – Medixine is proud to announce that the Nonin Health platform, co-developed with Nonin Medical and built on Medixine’s digital health technology, is now fully live and available for use. With this launch, clinicians, care providers, and patients can immediately benefit from a connected, cloud-based system designed to simplify the collection, analysis, and use of oxygen saturation (SpO₂) and pulse rate data.

The launch of Nonin Health marks only the beginning of this new digital care capability. The platform has been first made available to selected providers and partners in the United States, with a broader rollout planned to reach Nonin’s global customer base in the coming months. As the service expands internationally, Nonin and Medixine aim to bring the same seamless, connected care experience to hospitals, clinics, and patients worldwide — ensuring that high-quality oxygen data and actionable insights are accessible wherever care is delivered.

With Nonin Health, we’re taking the trusted accuracy of Nonin pulse oximetry and making it available wherever care happens,” said Rashad Buckner, Senior Director of Global Marketing, Nonin Medical. “By combining our sensor technology with the unique Medixine’s cloud platform, clinicians can see high-quality pulse oximetry data in real time, streamline their workflows, and stay closer to their patients without adding complexity. This innovative product allows physicians to measure overnight oxygen and creates a pathway to a full overnight testing solution which provides both organizations access to a market valued over \$350M.”

Until now, many providers have grappled with disconnected workflows — manual data downloads, delayed reporting, and cumbersome device handling. Nonin Health changes that by offering real-time, secure access to pulse oximetry data via the cloud. Using the Nonin WristOx₂ Model 3150 BLE sensor, patient SpO₂ and pulse data are transmitted automatically and accessed through a web portal.

For patients, the experience is equally streamlined. The mobile app pairing and automatic synchronization require minimal effort — enabling comfortable at-home use without technical burden. The improved ease of use encourages adherence and helps ensure that providers receive high-quality, usable data.

“The Nonin partnership provides the entry to the US market for Medixine. Our joint offering will grow to a series of use case specific services that offers a huge potential for Medixine”, said Dr. Tapio Jokinen, founder of Medixine.

With Nonin Health live, Medixine and Nonin are confident that patient care will improve through faster insight, more consistent monitoring, and more efficient clinical decision-making. This launch transforms the promise of connected pulse oximetry into everyday reality.

About Medixine

Medixine is a digital health technology company specializing in a remote patient monitoring solution that empower healthcare professionals and organizations to deliver better, data-driven care.
